Sprint 9 Final Handoff — March 19, 2026

Sprint 9 Completed

Major session covering MCP Target integration from Notion, comprehensive mobile responsiveness overhaul across all pages, macro table consolidation, UI polish, and Performance tab upgrades. Also identified Composite_Returns.xls as the authoritative performance data source for Sprint 10.

1. MCP Target Column — Holdings Tab

Added MCP Target as a new column in the Holdings table, pulling from the existing Notion MCP Master Holdings database (mcp_target field was already fetched by notion_metrics.py, just not displayed). Positioned immediately left of the Baseline column.

- Displays as $XXX or — if not set in Notion
- Lambda formatter handles mixed numeric/string values
- column_config entry with TextColumn width='small'

2. MCP Target Replaces Finviz Consensus Target

Replaced Finviz Wall Street consensus target with MCP's proprietary target price across two locations: the Finviz analyst panel on the Holdings tab and the Analyst & Technical Signals section on the Stock Detail page.

- Upside recalculated as (mcp_target - price) / price * 100
- Section header: 'Analyst Ratings & MCP Price Targets'
- KPI label: 'Avg Upside to MCP Target'
- Stock Detail: Notion data fetched via fetch_notion_metrics() (5-min cache TTL)
- Source captions updated to credit Notion for targets

3. Mobile Header Fix

Fixed the firm name wrapping to three lines on iPhone. Added CSS class names to header.py (mcp-header, mcp-logo, mcp-firm-name, mcp-firm-sub, mcp-header-right) for mobile CSS targeting.

- Tablet (768px): firm name 14px, letter-spacing 0.08em
- Phone (480px): header stacks vertically, firm name 13px, date/time left-aligned below logo
- Logo gets flex-shrink:0 so it never compresses
- white-space:nowrap on firm name prevents mid-word breaks

4. Mobile Table Scrolling Improvements

Improved horizontal scrolling for dataframes and custom HTML tables across all tabs.

- Deeper CSS targeting on stDataFrame nested containers and iframes
- Subtle right-edge gradient fade as visual scroll hint
- overflow-y:hidden on iframe to reduce vertical scroll trapping
- Generous height calculation (80 + rows * 40) to minimize internal scrollbar

5. Stock Detail Page — Mobile Overhaul

Replaced all st.columns(6) layouts with responsive HTML flex grids throughout the Stock Detail page.

- Finviz analyst row (Rating, MCP Target, Upside, RSI, Short Float, Earnings): flex-wrap 3x2 grid on mobile
- SMA/Ownership row: same flex pattern
- Performance row (Week/Month/Quarter/Half/Year/YTD): same flex pattern
- Quick Stats row (Mkt Cap, Div Yield, etc.): converted from st.columns(6) to HTML flex
- Valuation rows (P/E, Fwd P/E, PEG, etc.): both rows converted to HTML flex
- Back button shortened to 'Back' with use_container_width=True
- Added inject_mobile_css() call — Stock Detail was missing it entirely

6. Peer Comparison Table — Scrollable

Fixed the sector peer comparison table crushing columns on mobile. Replaced table-layout:fixed with pixel-based column widths and min-width:680px. Each row wrapped in overflow-x:auto scroll container with white-space:nowrap on all cells.

7. Macro Tab — Consolidated Tables

Rebuilt Economic Indicators and Market Valuation tables from separate-table-per-row rendering (which caused column misalignment on mobile) to single unified tables inside shared scroll containers.

- Economic Indicators: single table, min-width:580px, 8 rows
- Market Valuation: single table, min-width:480px, ~7 rows
- Both well under Streamlit's HTML size limit

8. KPI Cards — Responsive + YTD Removed

Converted KPI cards from st.columns(5) to HTML flex grid (display:flex;flex-wrap:wrap). Removed the YTD Return card (stale 'as of Feb 28' data) — now 4 cards: Daily Return, Cash, Dividend Yield, Holdings. Flex-basis bumped to 180px for cleaner desktop fill.

9. Performance Tab — Button Period Selector

Replaced the st.selectbox('Time Period') dropdown with a row of 5 st.button calls (YTD, 1Y, 3Y, 5Y, ITD) matching the price chart period selector pattern on Stock Detail.

10. UI Polish

- Top Contributors/Detractors: tightened layout with gap:8px, removed flex:1 gap pushing bp to far right

- Markets tab: added Brent Crude (BZ=F) to Indices section
- Mobile CSS: compact button styling (11px, 6px/8px padding) for period selectors
- Mobile CSS: flex-wrap rule for button rows

Files Modified

File	Description
pages/1_Dashboard.py	MCP Target column, movers layout, perf buttons, dataframe heights
pages/2_Stock_Detail.py	MCP Target, flex grids for all metric rows, mobile CSS import, back button
data/finviz_tab.py	MCP Target replaces Finviz consensus, notion_data param
data/macro_tab.py	Single-table consolidation for econ indicators + valuation
data/markets_tab.py	Added Brent Crude
components/kpi_cards.py	HTML flex grid, YTD card removed, 4-card layout
components/header.py	CSS class names for mobile targeting, flex-wrap
utils/mobile_css.py	Header responsiveness, table scroll, button compact, iframe fix

Key Learnings

- PowerShell uses semicolons (;) not && for chaining git commands
- Streamlit st.columns(6) stacks to 6 full-width rows on mobile — HTML flex grids with flex-wrap are the fix
- Separate HTML tables per row (Streamlit size limit workaround) causes column misalignment on mobile — consolidate into single tables when row count allows
- Streamlit dataframe iframe traps vertical scroll on mobile — generous height calculation is the most reliable fix; CSS overflow-y:hidden helps but doesn't fully solve
- Streamlit strips onclick from HTML — period selector buttons must remain as st.button widgets, not pure HTML
- flex:1 1 130px;min-width:100px creates a responsive grid that naturally wraps: 6 across on desktop, 3x2 on tablet, 2x3 on phone

Sprint 10 — Composite Returns Integration

Identified Composite_Returns.xls as the authoritative performance data source. This file contains actual composite performance aggregated from real client accounts (not backtested from current holdings), with monthly/quarterly returns back to inception for each strategy plus inline benchmark returns.

Strategy blocks found:

- QDVD Composite — inception Jun 2010, 153 monthly data points, benchmarks: S&P 500 + S&P 500 High Div
- SMID Composite — inception Dec 2014, benchmarks TBD from file
- DAC Composite — inception Dec 2015, benchmarks TBD from file
- OR Composite — inception Sep 2017, 100 monthly data points
- Balanced Composite — inception Jun 2010

- Income Composite — inception Sep 2010

Sprint 10 deliverables:

- Build composite_returns.py parser (OneDrive path first, data/ folder fallback for Cloud)
- OneDrive path: C:\Users\RyanAdair\Martin Capital Partners LLC\Eugene - Documents\Performance\Composite Returns\Composite Returns.xls
- Replace Strategy_Returns.xlsx as primary performance data source
- Rebuild Performance tab: cumulative chart, risk metrics, heatmap from real composite data
- Surface Period Returns summary (QTD, YTD, 1Y, 3Y, 5Y, 10Y, Since Inception)
- Remove Return Attribution section (cannot compute accurately without trade history)

Files to upload for Sprint 10:

- pages/1_Dashboard.py
- pages/2_Stock_Detail.py
- data/performance.py
- data/finviz_tab.py
- data/finviz_data.py
- data/macro_tab.py
- data/markets_tab.py
- data/market_data.py
- data/notion_metrics.py
- data/dividends_tab.py
- components/kpi_cards.py
- components/header.py
- utils/mobile_css.py
- utils/config.py
- Composite_Returns.xls
