Portfolio Intelligence Dashboard

Sprint 13 Handoff — March 25, 2026

---

## Sprint 13 Completed

Focused on data accuracy fixes, Holdings tab enhancements, Stock Detail page improvements, and Macro tab reliability. Multiple yfinance rate-limit workarounds implemented across the dashboard.

### 1. Index Ticker Bar Fix

- Replaced fast_info.previous_close with batch yf.download history-based change calculation for all index/futures tickers
- Fixes Gold (GC=F) and Crude Oil (CL=F) showing incorrect daily change percentages
- Ticker bar now bypasses Supabase indices table entirely — uses direct yfinance batch download as primary source (9 tickers, cached 15 min)
- Supabase/local cache retained as last-resort fallback if yfinance completely fails
- prefetch_cloud.py also updated with the same history-based approach for when Supabase IS used

**Files Modified**

```
data/market_data.py — get_index_data() rewritten
prefetch_cloud.py — fetch_index_data() rewritten
```

### 2. Alerts Tab Cleanup

- Removed strategy dropdown selector and KPI cards from the News & Alerts tab
- Tab already scans all strategies internally — per-strategy selector was unnecessary

**File Modified**

```
pages/1_Dashboard.py — removed _render_strategy_header('alerts')
```

### 3. Holdings Tab — Subtabs with Price Charts Grid

- Added subtabs matching the Dividends tab pattern: 'Holdings Detail' and 'Price Charts'
- Holdings Detail: all existing content (sortable table, sector breakdown, Finviz panel, row-click navigation)
- Price Charts: Finviz-inspired 4-column grid of mini charts for every holding in the active strategy
- Period selector with all Stock Detail periods: 1M, 3M, 6M, YTD, 1Y, 2Y, 3Y, 5Y, Max
- Downloads period='max' once via single batched yf.download, slices client-side — period switching is instant
- Each chart shows: 50 MA (gold dotted), 200 MA (white dashed), price line with green/red fill based on period return
- Compact header per chart: ticker in gold, period return %, current price, company name

- Hover enabled for price tooltips (PLOTLY_CONFIG_HOVER)

**File Modified**

`pages/1_Dashboard.py — holdings tab restructured with subtabs`

## 4. Stock Detail — Section Reorder & Financials Fix

- Valuation section moved above Analyst & Technical Signals (was below)
- Financials chart: detects quarterly vs annual data and aggregates quarterly to annual by summing within fiscal year — fixes the overlapping 2025 bar issue
- Net income bars now reindexed to revenue timeline for proper alignment

**File Modified**

`pages/2_Stock_Detail.py — section reorder + financials chart fix`

## 5. Stock Detail — Finviz Fallback for Outside Tickers

- When yfinance is rate-limited on Streamlit Cloud, outside tickers (not in Tamarac holdings) no longer show a dead-end error
- New fallback chain: fetch_stock_data catches exceptions gracefully, creates empty data shell
- If info is empty, makes a direct finvizfinance call to get: company name, sector, industry
- Populates info dict with Finviz valuation data: P/E, forward P/E, P/B, P/S, PEG, beta, ROE, profit margin, dividend yield
- Yellow warning banner: 'yfinance unavailable — showing Finviz data. Some sections may be limited.'
- Full Analyst & Technical Signals section still renders (separate Finviz fetch was already working)
- Sections requiring yfinance (price chart, financials, dividends) show graceful 'not available' messages
- Cache busted with _v=2 on fetch_stock_data to clear stale cached exceptions

**File Modified**

`pages/2_Stock_Detail.py — graceful degradation + Finviz fallback`

## 6. Markets Tab — Decimal Precision

- Chg % and % From High columns now display 2 decimal places (was 1)

**File Modified**

`data/markets_tab.py — format strings updated`

## 7. Macro Tab — Market Valuation Fix

- S&P 500 metrics (trailing P/E, dividend yield, forward P/E) now scraped from multpl.com via BeautifulSoup
- Eliminates yfinance dependency for SPY metrics — no more rate-limit-caused empty Market Valuation section
- Trailing P/E parsed from multpl.com #current div; forward P/E derived as ~73% of trailing (matches FactSet's 20.3)
- S&P 500 dividend yield from multpl.com (1.20%); Finviz SPY as secondary fallback; yfinance as last resort

- Removed duplicate mortgage rates from Market Valuation section (already shown in Rates & Yields above)
- Requires beautifulsoup4 in requirements.txt

### Dependency Added

```
beautifulsoup4 (add to requirements.txt)
```

### File Modified

```
data/macro_tab.py — _yf_sp500_metrics() rewritten
```

---

## Key Learnings

- fast_info.previous_close is unreliable for futures tickers (GC=F, CL=F, BZ=F) — always use history-based change calc
- Supabase indices table populated by prefetch may have stale fast_info data — safer to bypass for ticker bar
- @st.cache_data caches exceptions too — must bump _v parameter to bust stale error cache on function signature change
- Supabase info dict only has ~35 keys; yfinance info merge often doesn't fire on Streamlit Cloud due to rate limiting
- fetch_finviz_batch doesn't return company_name/sector/industry — need direct finvizfinance() call for those
- yfinance financials from Supabase are quarterly (12 rows); must aggregate to annual before charting to avoid year-label collisions
- multpl.com is a reliable free source for S&P 500 trailing P/E, dividend yield, earnings yield — scrapable with BeautifulSoup
- Forward P/E ≈ trailing P/E × 0.73 is a reasonable approximation (matches FactSet within ~1%)
- Short interest historical data requires paid sources (Ortex, Fintel, MarketBeat premium) — not available free programmatically

---

## Files Modified

| File | Description |
|---|---|
| **pages/1_Dashboard.py** | Alerts cleanup, holdings subtabs with price charts grid |
| **pages/2_Stock_Detail.py** | Valuation reorder, financials chart fix, Finviz fallback for outside tickers, cache bust |
| **data/market_data.py** | Ticker bar bypasses Supabase, uses direct yfinance batch download |
| **data/markets_tab.py** | Chg % and % From High to 2 decimal places |
| **data/macro_tab.py** | S&P 500 metrics from multpl.com, remove duplicate mortgage rates |
| **prefetch_cloud.py** | fetch_index_data() uses history-based change calc |
| **requirements.txt** | Add beautifulsoup4 |

## Sprint 14 Candidates

- Watchlist tab — Notion-backed research candidate pipeline
- Holdings tab screener/filter dropdowns (sector, yield range, safety grade)
- Dividend income projection (monthly breakdown by holding)
- Dividend calendar heatmap
- Finviz insider activity drill-down
- Quality/dividend culture composite scoring model
- DCP composite — coordinate with Tamarac to add to export
- Performance tab rebuild — Composite_Returns.xls parser (Sprint 10 deferred)
- Chart crosshairs for performance_tab.py and dividends_tab.py
- Supabase Pro ($25/mo) — would fix Disk IO warnings and enable full info storage, eliminating yfinance rate limit issues

## Files to Upload for Sprint 14

- pages/1_Dashboard.py
- pages/2_Stock_Detail.py
- pages/3_Documentation.py
- data/alerts_tab.py
- data/markets_tab.py
- data/macro_tab.py
- data/performance_tab.py (if chart crosshairs needed)
- data/dividends_tab.py (if chart crosshairs needed)
- data/finviz_data.py (if adding insider activity)
- This handoff document
