Sprint 5 Handoff Document — March 10, 2026

For internal use only. Prepared for Ryan Adair (Operations/IT Lead).

---

1. Sprint 5 Summary

Sprint 5 focused on four areas: Tamarac file auto-detection, Notion integration for proprietary metrics, Holdings tab enhancements, Macro tab restructuring, and a new Markets tab. Data resilience was improved across the board with multiple fallback mechanisms for yfinance and FRED data sources.

Completed This Session

- Tamarac Auto-Detector — scans configured directories for the newest Tamarac export file, surfaces stale-data warnings, auto-busts cache when the file is modified
- Notion Integration — pulls MCP Dividend Baseline and MCP Style Bucket from the MCP Master Holdings Notion database into the Holdings tab
- Holdings Tab Upgrades — added Baseline, Style, Unit Cost, and % From 52W High columns; removed 52W High/Low; sector breakdown now has compact table + donut pie chart
- Macro Tab Restructure — moved Dividend Strategy Context and Sentiment sections up (replacing 2s10s chart), Market Valuation now full-width at bottom
- Markets Tab (new) — single-page market overview with U.S. indices, sector ETFs, fixed income, global markets, and commodities; one batched yfinance call for ~30 tickers
- Data Resilience — 30Y Treasury fallback when 10Y unavailable, S&P div yield from dividendRate/price, trailing P/E fallback for ERP calculation, auto-bust Tamarac cache on file modification

2. New & Modified Files

New Files

File	Purpose
data/tamarac_detector.py	Tamarac file auto-detection, stale-data warnings, status banner
data/notion_metrics.py	Notion API integration — fetches Dividend Baseline + Style Bucket
data/markets_tab.py	Markets tab — indices, sectors, fixed income, global, commodities

Modified Files

File	Changes

pages/1_Dashboard.py	Tamarac detector + Notion import; Holdings: Baseline, Style, Unit Cost, % From Hi columns; sector pie chart; Markets tab wired in; cache auto-bust on file mtime
data/macro_tab.py	Layout restructure: Div Context + Sentiment moved up, Valuation full-width; 30Y fallback; S&P div yield + P/E fallback chain

3. Notion Integration

The dashboard now reads proprietary metrics from the MCP Master Holdings Notion database via the Notion API.

How It Works

- notion_metrics.py queries the MCP Master Holdings database (ID: 29cff1792e3c461d978af87ca1bea797)
- Extracts: MCP Dividend Baseline (number), MCP Style Bucket (select: DG/HG/TC/HY), CLD Source, MCP Target, Strategies
- Data cached with @st.cache_data(ttl=300) — refreshes every 5 minutes
- Keyed by uppercase ticker symbol; merged into Holdings tab as Baseline and Style columns
- If Notion API is unreachable, columns show "—" and the rest of the table works normally

Secrets Required

Add to Streamlit Cloud Settings > Secrets:

```
NOTION_TOKEN = "ntn_..."
Or nested: [notion] / token = "ntn_..."
```

4. Tamarac Auto-Detector

The detector scans multiple directories for the newest Tamarac holdings export file and surfaces status information in the dashboard.

Scan Priority Order

- TAMARAC_WATCH_FOLDER from config (if set)
- data/tamarac_imports/ subfolder
- data/ directory
- Project root

File Patterns Matched

Tamarac_Holdings*.xlsx, tamarac_holdings*.xlsx, Tamarac_Export*.xlsx, Holdings_Export*.xlsx

Cache Auto-Bust

The _load_tamarac() function now includes the file's modification timestamp as a cache key parameter. Any time the spreadsheet is saved (and committed to git for Streamlit Cloud), the cache automatically invalidates without needing a manual clear.

5. Markets Tab

New tab providing a broad market snapshot using ETF proxies. Single scrolling page with five sections.

Sections

- U.S. Equity Indices — S&P 500, DJIA, Nasdaq 100, Russell 2000, VIX
- S&P Sector ETFs — all 11 sectors, auto-sorted by daily performance
- Fixed Income ETFs — Treasuries, TIPS, High Grade, High Yield, Munis, Convertibles
- Global Markets — two-column layout: Developed (EFA, EWJ, EWU, EWG, EWA, EWQ) and Emerging (EEM, FXI, EPI, EWZ, EWW, EWY, EZA)
- Commodities — Gold, Crude Oil, Brent Crude, Natural Gas, Silver, Copper

Performance

All data from one batched yf.download() call (~30 tickers), cached 15 minutes. No Supabase tables required. Big movers (±2%) get a subtle background highlight.

6. Known Gotchas (Cumulative)

- PLOTLY_DARK contains a margin key — never pass margin= as a kwarg alongside **PLOTLY_DARK. Build layout dict separately
- PLOTLY_DARK legend contains a legend key — same pattern: override in the dict, not as a kwarg
- Supabase pagination — always use limit/offset params, NOT Range header
- @st.cache_data — requires full server restart to clear (deleting market_cache.db alone doesn't work)
- yield_at_cost — Tamarac stores as decimal (0.0558); multiply by 100 for display only
- File workflow — download Claude's output, copy to project folder, git add/commit/push. Never upload stale files mid-session
- Windows paths — use Path(__file__).parent.parent for path resolution; relative paths break from VBS startup scripts
- st.switch_page() — store target ticker in both st.session_state and st.query_params before switching
- Web scraping CCC data — sites block automated requests. Use the Fish Excel file instead
- Windows encoding — Python on Windows defaults to cp1252. Always use encoding='utf-8' when writing files

- Fish data types — Fish streak_began field can be int, float, or string. Always wrap in try/except
- Notion token — must be in Streamlit Cloud secrets as NOTION_TOKEN or [notion] token
- FRED DGS10 outages — macro tab now falls back to 30Y automatically; labels update dynamically to show which rate is used
- yfinance SPY .info — forwardPE, trailingPE, and dividendYield can all return None on Streamlit Cloud; fallback chain computes P/E from trailingEps/price and div yield from dividendRate/price
- Tamarac cache — now keyed on file mtime; edits to the spreadsheet auto-bust the cache after git push

7. Git Deployment

All files from this sprint:

```
cd "C:\Users\RyanAdair\Martin Capital Partners LLC\Eugene - Documents\Operations\Scripts\Portfolio Dashboard"
```

```
git add data/tamarac_detector.py data/notion_metrics.py data/markets_tab.py
```

```
git add data/macro_tab.py pages/1_Dashboard.py
```

```
git commit -m "Sprint 5: Tamarac detector, Notion integration, Markets tab, Macro restructure"
```

```
git push
```

8. Sprint 6 Priorities

- Alerts feed — ticker ±2% triggers, dividend announcements, Morningstar rating changes
- Dividend income projection — annualized income by strategy, broken out monthly by holding
- Dividend calendar heat map — monthly view of ex-div dates across the year
- Quality/dividend culture scoring — automated grading per holding based on Fish + fundamental data
- Tamarac folder watcher — auto-detect new Tamarac exports dropped in watch folder

On Hold / Future

- Strategy Allocation Excel integration (deferred until clearer use case)
- Mobile home screen optimization (responsive testing)
- Custom domain setup
- yfinance sector name mapping (Consumer Defensive → Consumer Staples, etc.)

9. Next Session Startup

Upload these files when starting Sprint 6:

- This handoff document (Sprint_5_Handoff.docx)

- pages/1_Dashboard.py
- pages/2_Stock_Detail.py
- data/dividends_tab.py
- data/dividend_streaks.py
- data/macro_tab.py
- data/markets_tab.py
- data/notion_metrics.py
- data/tamarac_detector.py
- data/tamarac_parser.py
- utils/config.py
- Tamarac_Holdings.xlsx
